Appendix D -	Concentration Trend Graphs

## **1.0 INTRODUCTION**

This report presents the results of groundwater sampling performed at the French Limited Superfund site, Crosby, Texas, for the 2nd half of 2000. Aquifer measurements and sampling were completed in July, 2000.

Analytical results of the July, 2000, sampling are tabulated in Appendix A, including historic results since the shutdown of active remedial operations in December, 1995, and QAQC summary.

The July, 2000, water level and chemical concentration figures are shown in Appendix C.

---

## 2.0 PROGRESS MONITORING

Groundwater measurements and sampling were performed by Remedial Operations Group, Inc., (ROG), on July 6, 7, 10, 11, 12, 13, 14, 17, 18, and 19, 2000. Measurements and sampling were performed in general accordance with Table 12.1, "Progress Monitoring Wells (1996-2005)", of the approved site closure plan<sup>1</sup>.

Locations of wells used for sampling and water level monitoring are shown in Figures 2-1 through 2-3. These figures also show the area where the S1 and INT units are not separated by the C1 clay aquitard. The area of this "C1 window", where the C1 clay unit is absent, is taken from *Evaluation of Stratigraphic Controls on DNAPL Migration*<sup>2</sup>.

Data management and QA/QC were performed by ROG. Analytical results were tabulated by ROG (Appendix A). Table 2-1 summarizes the analytical results for all wells. Appendix D contains the concentration trend graphs for the wells highlighted in Table 2-1.

### 2.1 Concentration > MCL

Groundwater samples from the wells with concentrations at or exceeding MCL's are presented in Table 2-2 for July, 2000.

### 2.2 Residual Nitrate

Residual nitrate exceeded 0.5 mg/L-N at 11 wells, summarized in Table 2-3.

### 2.3 pH

Field pH values at nearly all wells were within the range 6.0-8.0, which is conducive to intrinsic bioremedial activity. Nearly all wells had pH values falling inside this range. Field pH values falling outside this range were 9.54 at INT-118 and 8.69 at INT-144 for July, 2000.

Table 2-1  
French Ltd. Progress Evaluation

Well Name	Comments
FLTG-013	11DCA (4 ppb); Compound concentration has been consistently at low levels (< 10 ppb) since 1992 with intermittent ND
FLTG-014	Chlorinated chemicals detected at low levels in January event; All ND in July sample
INT-022	Bnz at 3 ppb in January event; All ND in July sample
INT-026	Bnz concentration increased in Feb'98 from ~50 to ~300 ppb; Concentration has not changed significantly since Feb'98
INT-059-P-2	Typically a metals only well; All ND in July sample
INT-060-P-3	All ND in July sample
INT-101	Bnz staying in the low ppb range (detected at less than 10 ug/L) since January '99
INT-106	Chlorinated chemicals detected at low levels (less than 150 ppb) in July '00 event; No significant change since January '99
INT-108	All ND in July sample
INT-118	All ND in July sample
INT-120	Chlorinated chemicals detected at low levels (less than 50 ppb) in July '00 event; No significant change since April '96
INT-123	Chlorinated chemicals detected at low levels (less than 50 ppb) in July '00 event; No significant change since January '99
INT-127	Bnz concentration increasing slightly since October '98; Other BTEX compounds also detected intermittently
INT-130R	Chlorinated chemicals detected at high levels in July '00 event; No significant change since '98
INT-130RS	Chlorinated chemicals detected at medium-high levels in July '00 event; No significant change since '98
INT-134	Bnz and chlorinated compounds fluctuating but decreasing slightly since January '99
INT-135	Vinyl chloride persistent and other chlorinated compounds intermittently detected at low levels (less than 50 ppb)
INT-144	Vinyl chloride detected at low level (less than 10 ppb); VC intermittently detected over last few years
INT-214	All ND in July sample
INT-217	Bnz, 11DCA and VC detected at low levels (less than 25 ppb); Concentrations fluctuating but no significant trend since '98
INT-233	Bnz and chlorinated compounds fluctuating with possible upward trend since '97
S1-031	Bnz detected below cleanup criteria
S1-033	All ND in July sample
S1-051-P-3	Bnz increased to 23 ppb; Never detected above cleanup criteria during monitoring phase
S1-106A	Bnz and some chlorinated compounds fluctuating at low levels (less than 30 ppb)
S1-106R	Bnz fluctuating but less than 50 ppb
S1-108A	All ND in July sample
S1-111	Typically a metals only well; All ND in July sample
S1-118	All ND in July sample
S1-121	Bnz and chlorinated compounds fluctuating with possible upward trend since '97
S1-123	Chlorinated chemicals detected at high levels in July '00 event; Fluctuating with no significant trend since '97
S1-131	Bnz fluctuating but less than 50 ppb
S1-135	All ND in July sample

**Bold print indicates wells with potential significant data trends - Concentration trend graphs were prepared for these wells (see Appendix D)**

## **2.4 Contour Maps**

Contour maps for water level, nitrate, dissolved oxygen (DO), total organic carbon (TOC), benzene, 1,2-dichloroethane (1,2-DCA), vinyl chloride and affected groundwater for the S1 and INT units in July, 2000, are presented in Figures 2-4 through 2-17 in Appendix C and discussed in Section 2.4.1. through Section 2.4.8. Contours are inferred from, the July, 2000, sampling results at progress monitoring wells, results of previous quarterly sampling at wells which are now plugged, and monitoring data obtained during active operations (between January, 1992, and December, 1995). Therefore, the contours presented are not based solely on the data shown on the contour maps, but incorporate judgement based on four years of historic monitoring data at a significantly wider well network. Former wells are shown on the chemical plume maps.

### **2.4.1 Water Levels**

The water level measurements in July, 2000, were used to develop the respective groundwater contours and flow direction maps.

Water levels for the post-operational phase tend to reflect short-term, localized influences. Short-term rainfall events and beaver activity in the area affect the water level in the South Pond and other surface water bodies, which act as localized recharge or discharge areas depending on recent rainfall relative to average. The normal maximum level for the South Pond appears to be controlled by a downstream beaver dam. The South Pond was near the normal maximum level during the July, 2000, sampling event.

The S1 and INT water level maps indicate that significant downward leakage from the S1 unit to the INT unit occurs in a localized area south of the west end of the former lagoon, where the C1 clay is absent ("C1 window"). In this area, the average hydraulic gradient in the S1 unit is northeast towards the C1 window, whereas the average hydraulic gradient in the INT unit is to the southwest, away from the C1 window. This trend has been consistent since active remediation ended.

The other consistent feature is the low hydraulic gradient south of the former lagoon and east of the C1 window. In both the S1 and INT units, the gradient is generally to the southeast, away from the clay window. Overall, it appears that the cutoff wall has created stagnant groundwater flow conditions in the area south of the former lagoon.

Three sets of paired S1 unit monitoring wells track head differences across the cutoff wall, which enclosed an active phytoremediation area. The well pairs are P-6/P-5; S1-119/S1-121; and S1-126/S1-64. The first well of each pair is inside the cutoff wall; the second well is outside. Head differences are shown in Figure 2-4. In July, 2000, hydraulic gradients were generally outward. It is planned that phytoremediation will eventually reverse this head difference.

The effectiveness of the steel sheetpile cutoff wall system used at the French Limited site was confirmed by testing described in *INT-11 DNAPL area, cutoff wall installation and*

*permeability certification report*<sup>3</sup>. This report concluded that the cutoff wall is equivalent to a conventional 2.5-foot thick slurry wall with a permeability of  $1 \times 10^{-9}$  cm/sec. Hence, an outward hydraulic gradient will not result in significant outward migration of groundwater. The integrity of the wall was tested in May, 2000, and the results indicate no degradation of the wall; the test plan and results are in Appendix B.

#### **2.4.2 Nitrate**

Nitrate contour maps for July, 2000, are presented in Figures 2-6 and 2-7. There was little change over the last 6 months in the S1 unit and most of the INT unit. This is consistent with the slow movement of groundwater over much of the area south of the steel sheetpile cutoff wall (see Section 2.5.1).

#### **2.4.3 Dissolved Oxygen**

Dissolved oxygen contour maps for January, 2000, are presented in Figures 2-8 and 2-9. Elevated DO concentrations in wells in both units reflect residual DO from the oxygen addition program. The area of elevated DO, and the maximum DO concentrations, have both decreased significantly in both units from a post-injection high in July, 1998. This may indicate use by aerobic bacteria to break down site chemicals.

#### **2.4.4 Total Organic Carbon**

Total organic carbon contour maps for July, 2000, are presented in Figures 2-10 and 2-11. TOC concentrations are generally similar to the previous 12 months in both the S1 and INT units.

#### **2.4.5 Benzene**

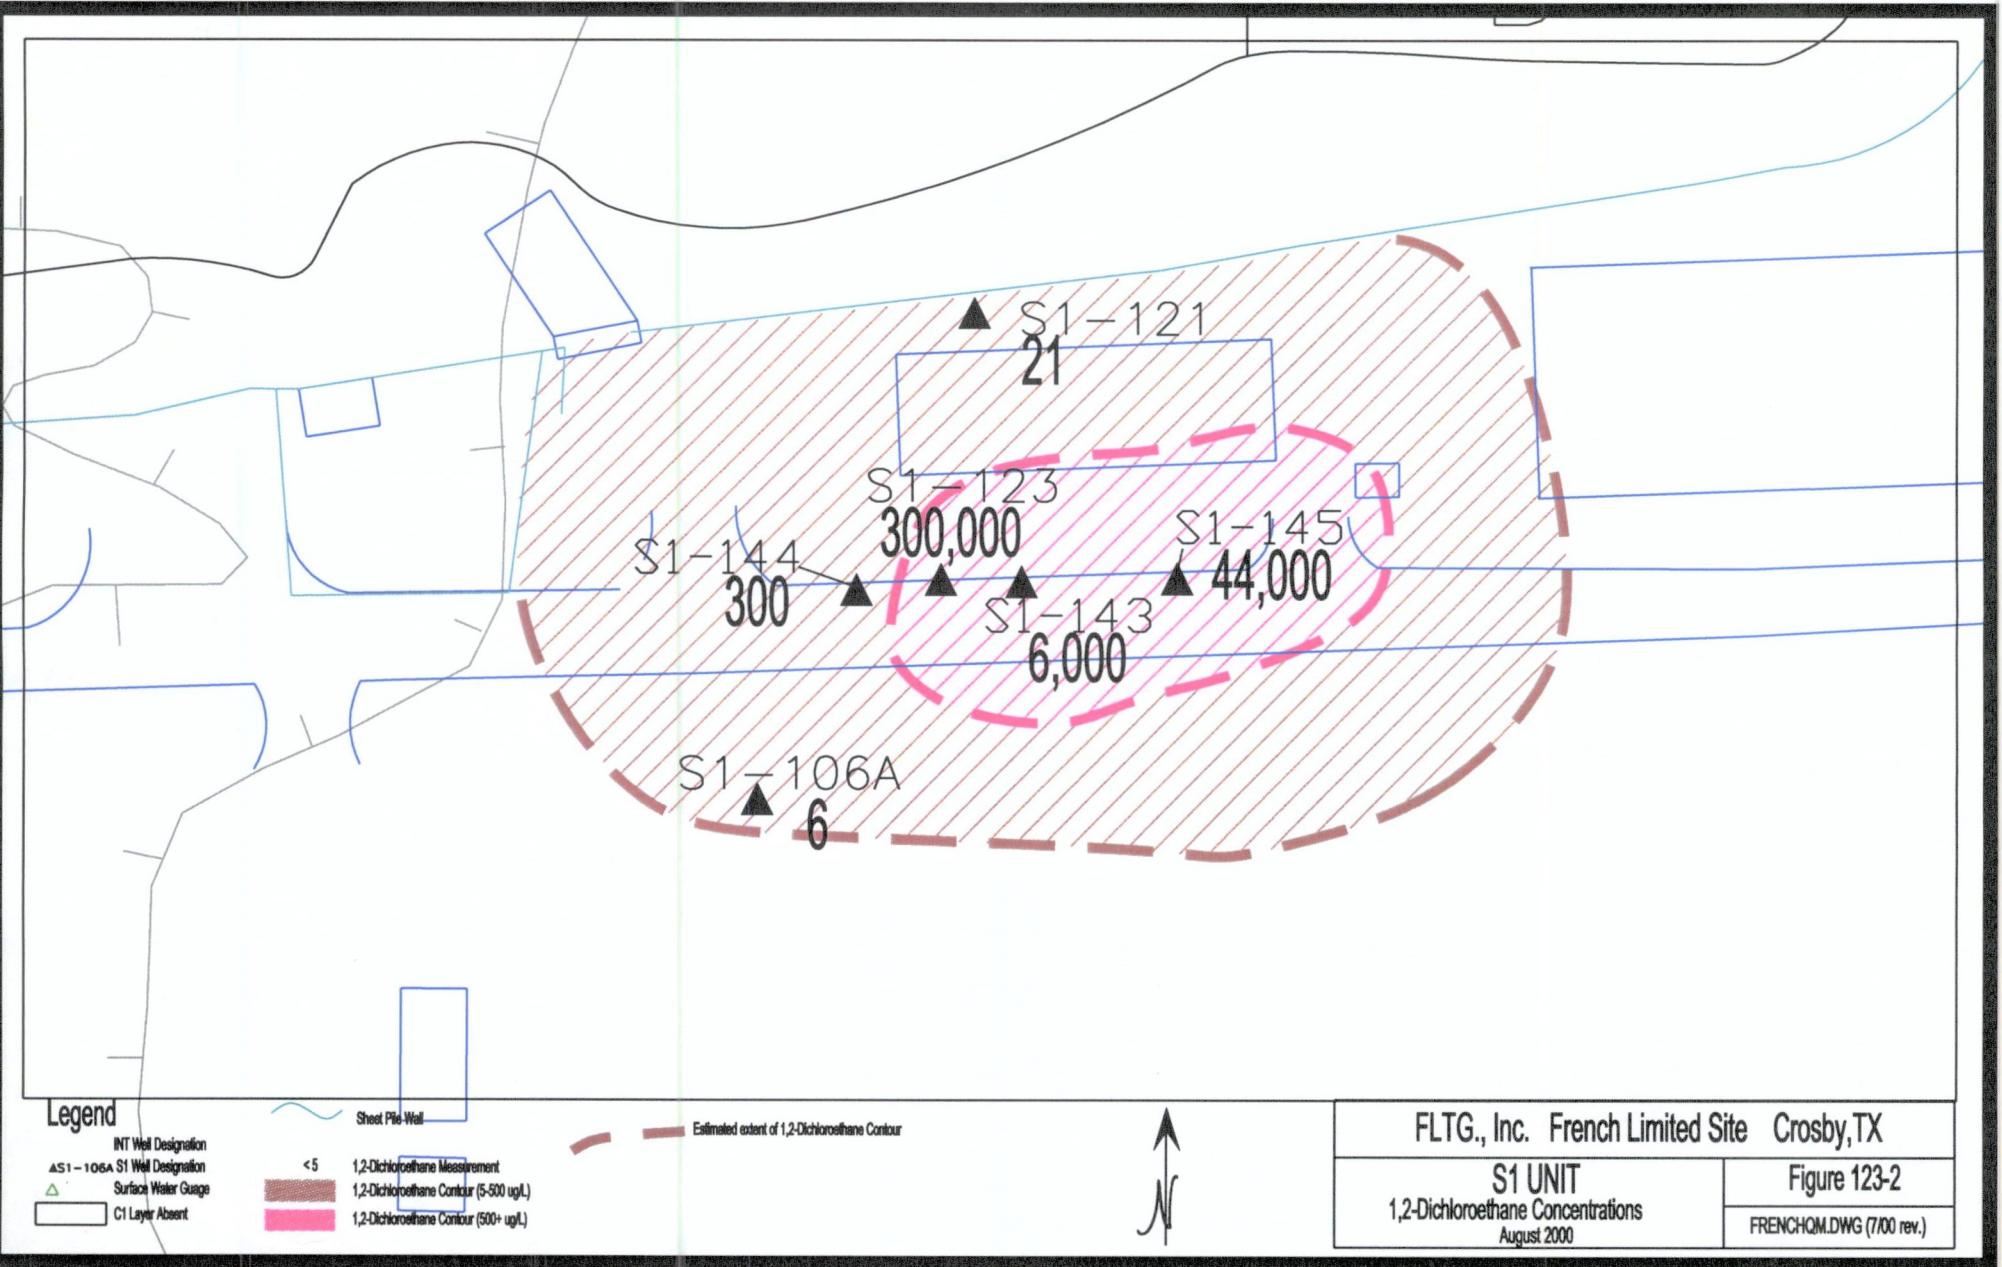

Benzene contour maps for July, 2000, are presented in Appendix C. Benzene concentrations are generally similar to the previous 12 months in both S1 and INT units. There were no significant changes in benzene concentrations over the last 6 months; there is no indication of rebound.

#### **2.4.6 1,2-DCA**

1,2-DCA contour maps for July, 2000, are presented in Appendix C. 1,2-DCA concentrations are generally similar to the previous 6 months in both the S1 and INT units. The concentration remains elevated at S1-123, but there have been no increases in adjacent wells. Three S1 wells were installed in the vicinity of S1-123 to define the extent of the 1,2-DCA; the localized 1,2-DCA plume in the vicinity of S1-123 is shown in Figure 123-2; the extent of the plume is undefined to the east; the elevated S1 concentrations of 1,2-DCA appear to be limited to the S1-123 area; two additional monitoring wells may be installed to better define the 1,2-DCA in the MW-123 area.

---

<sup>3</sup> Applied Hydrology Associates, Inc. August 1995.

#### **2.4.7 Vinyl Chloride**

Vinyl chloride contour maps for July, 2000, are presented in Appendix C. Vinyl chloride concentrations are generally similar to the previous 6 months in both the S1 and INT units. There does appear to be some attenuation in the southwest INT extension.

#### **2.4.8 Carbon Tetrachloride**

An INT carbon tetrachloride plume contour map for the INT-130R/RS area is presented in Figure 123-1. Carbon tetrachloride concentrations in INT-103R, INT-130RS, and INT-106 are generally similar to previous results. Five wells were installed in the vicinity of INT-130R/S to define the extent of carbon tetrachloride in this area; the results of these five wells have defined the general extent of the INT chloroform.

#### **2.4.9 Affected Groundwater**

The affected areas in July, 2000, have not greatly changed over the last 6 months. The affected S1 and INT groundwater does not represent a threat to the public health or the environment, because FLTG controls all property that contains elevated concentrations of chemicals in groundwater, and all areas containing affected groundwater are potentially subject to institutional controls.

However, the very limited groundwater movement, the absence of natural attenuation trends in many areas, and the elevated VOC's at S1-123 and INT-130R/RS, indicate that natural attenuation trends need to be closely evaluated over the next several years.

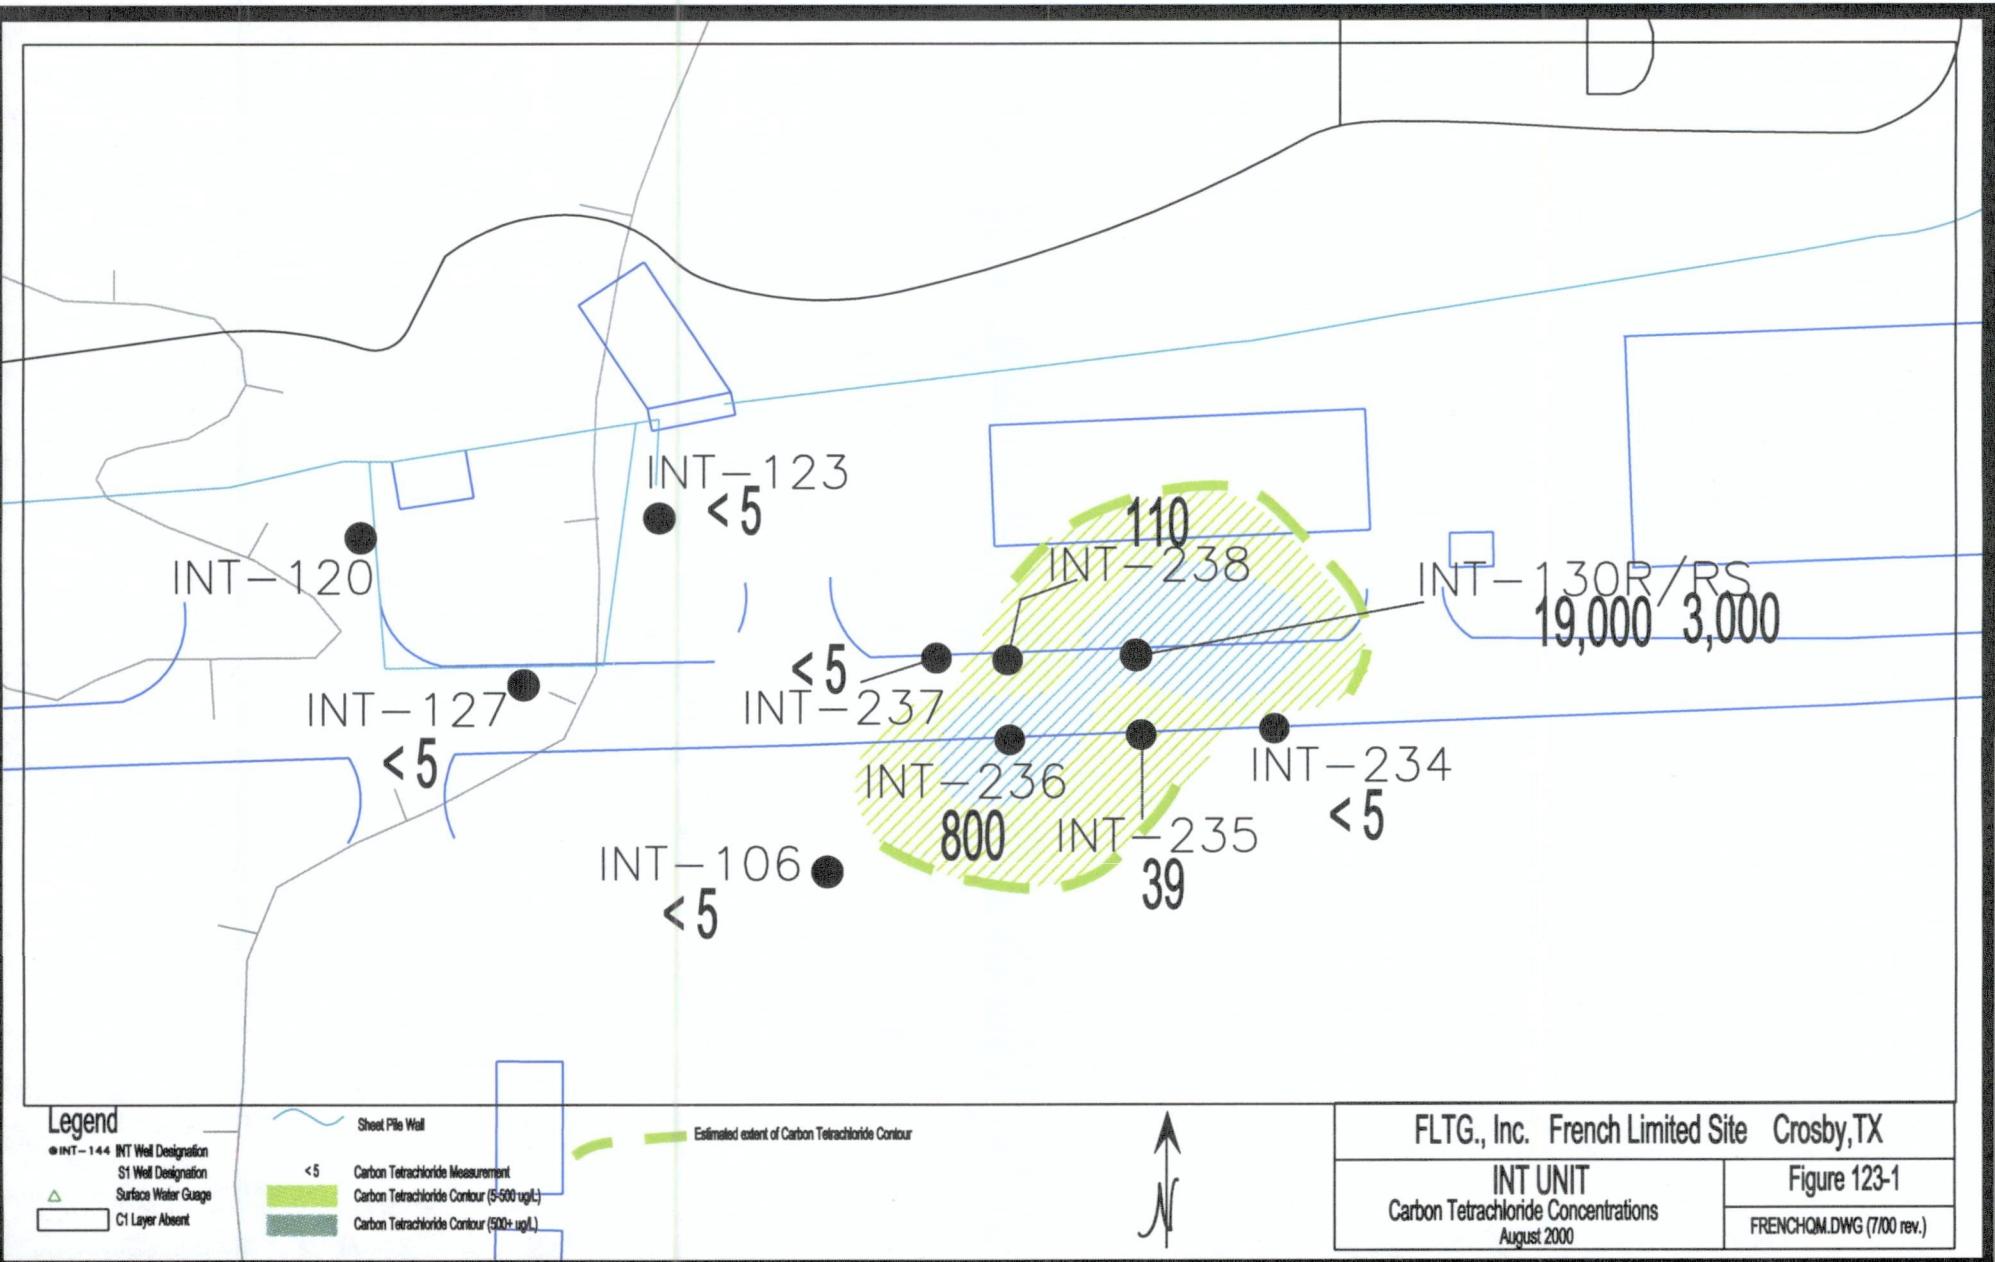

### **2.5 Five Year Sampling**

The site monitoring plan calls for regular monitoring of certain groundwater wells for volatile organic chemicals, which are the "target" chemicals at the site. However, once every five years, the available groundwater monitoring wells are sampled and analyzed for:

- Volatile organics
- Semi-volatile organics
- Metals
- Pesticides
- PCB's

The objective of the broad analytical list once every five years is to determine if any substances should be considered for inclusion on the "regular" analytical list.

The results of the July, 2000, "broad" analytical effort are included in Appendix A; the results do not indicate any significant changes from the previous "broad" analytical effort. It is concluded that regular monitoring for volatile organics will continue to accurately represent site status.

### **3.0 MODELING UPDATE**

The low migration rates and the generally stable chemical concentrations are consistent with the model. The plumes are starting to elongate to the southwest consistent with the natural gradients. The public health continues to be protected. Actual field data over the next 2-3 years will confirm the original model.

---

#### **4.0 CONCLUSIONS**

There have been no significant changes in the physical or chemical groundwater trends. There is no evidence of chemical "rebound" in any areas. The S1 and INT zones immediately downgradient of the cutoff wall show stagnant flow conditions. The INT plume to the southwest is attenuating consistent with the local gradient. The S1-123 area may require future focused action to address the elevated 1,2-DCA and other chlorinateds; the INT-130R/RS area may require future focused action to address the elevated chloroform and other chlorinateds.

## **5.0 ACTION PLAN**

**Measure water levels and sample wells twice per year. Maintain site and well security.  
Evaluate response options for S1-123 area and for INT-130R/RS.**

---

## **6.0 S1-123 and INT-130R/RS RESPONSE PLAN**

### **6.1 Current Status**

The chlorinated concentrations in the S1-123 area and the INT-130R/RS area are elevated and persistent and are not expected to naturally attenuate in 30 years; the chlorinateds in these two areas do not currently create a threat to public health or the environment. Some additional work may be done to better define the extent of both the S1 and the INT plumes in this area.

The INT plume extends across Gulf Pump Road; there are elevated concentrations of chloroform in INT-236, which is south of the road. The S1 plume may extend across Gulf Pump Road; this would need to be determined as part of a response plan.

### **6.2 Response Options**

The response options for the S1-123 are and the INT-130R/RS area are described below:

1. Better define the nature and extent of the chlorinateds in the S1 and INT.  
Monitor.  
Develop final plan based on better definition.
2. No specific action.  
Monitor as per site closure plan.  
Evaluate risk.
3. Purchase property south of Gulf Pump Road.  
Extend groundwater compliance boundary 600' to the southwest.  
Monitor as per site closure plan.
4. Focused pumping of S1 and INT wells and discharge to lagoon area.  
Monitor as per site closure plan.
5. Excavate soils containing DNAPL and dispose off-site.  
Backfill with clean soil and oxidizer.  
Monitor as per site closure plan.
6. Excavate soils containing DNAPL and treat on-site in bio pile.  
Dispose of soils as non-hazardous.  
Backfill with clean soils and oxidizer.
7. Contain the affected S1 water-bearing zone and the affected INT water-bearing zone with interlocking sheet steel sealed to the underlying Beaumont clay.  
Monitor as per site closure plan.

8. Contain the affected zones with a grout curtain sealed to the underlying Beaumont clay.  
Monitor as per site closure plan.  
Grout curtain material may be bentonite-based or polymer-based.
9. Install subsurface gate to focus groundwater migration in both zones. Treat water as the water passes through the gate with bioremediation or chemical oxidation. Focus the plumes through the gate with downgradient pumping wells.  
Discharge pumped water to lagoon area.  
Evaluate progress quarterly.
10. Install and operate in-situ bioremediation system.  
Pump from both the S1 and the INT zones; pump from the center of the affected zones.  
Discharge the pumped water to the lagoon area.  
Inject "clean" water with 20-30 ppm of dissolved oxygen and nutrients on the perimeter of the affected S1 and INT zones.  
Evaluate progress and refine the system quarterly.
11. Wash the affected soils by alternating cycles of injection for 30 days followed by pumping for 30 days.  
Inject "clean" water with oxygen and nutrients.  
Discharge pumped water to lagoon area.  
Evaluate progress and refine the system quarterly.
12. In-situ thermal desorption, soil vapor extraction, and vapor phase oxidation.  
Pump both zones to lower water levels to the bottom of the S1 and the INT zones.  
Evaluate progress and refine the system monthly.
13. Direct chemical oxidation of the chlorinated chemicals.  
Use H<sub>2</sub>O<sub>2</sub> or permanganate.  
Direct inject oxidizer into the affected S1 and INT zones.  
Evaluate progress and refine the system monthly.
14. Cosolvent flushing with methanol or isopropyl alcohol.  
Evaluate progress and refine the system monthly.

### **6.3 Response Option Comparison**

The response options are compared based upon:

- a) Regulatory compliance.
- b) Reduction in toxicity, mobility, or volume.
- c) Short-term effectiveness.
- d) Long-term effectiveness.
- e) Implementability.

- f) Cost.
- g) Schedule.
- h) Protect human health and the environment.

Table 6-3 compares the 13 options based on the criteria listed. Except where specifically noted, each option and criteria are rated on a scale of 1-10 with "1" being poor, negative, inadequate, and "10" being positive, excellent, satisfactory.

#### **6.4 Recommended Response Plan**

Option #3 (Purchase property south of Gulf Pump Road and extend compliance boundary 600' to the southwest) appears to be the most timely, cost-effective, and environmentally-sound option.

**Table 6-3**  
**Option Comparison**

Option	Evaluation Criteria								
	Regulatory Compliance	Protect Human Health and Environment	Reduction	Effectiveness		Implementability	Cost		Active Remediation Schedule (months)
				Short-term	Long-term		Design/Construction	Operation	
1. Definition future plan	5	3	1	5	NA	9	10,000	NA + 60K/yr	12+
2. Monitor	6	3	1	5	3	10	NA	60K/yr	NA
3. Purchase property	6	7	1	7	5	9	150,000	60K/yr	3
4. Focused pump	5	7	7	9	6	8	15,000	15K/mo + 60K/yr	12-15
5. Excavate/dispose	7	8	9	9	6	2	450,000	NA + 60K/yr	4
6. Excavate/treat	6	7	8	8	6	2	250,000	150,000 + 60K/yr	8-12
7. Sheet pile wall	6	8	8	9	8	5	300,000	NA + 60K/yr	5
8. Grout curtain	6	8	8	9	6	7	200,000	NA + 60K/yr	3
9. Subsurface gate/treatment	7	8	8	5	7	6	150,000	6K/mo + 60K/yr	12-15
10. In-situ bioremediation	8	8	8	4	7	7	130,000	20K/mo + 60K/yr	24-36
11. Soil washing	7	7	8	5	6	5	100,000	15K/mo + 60K/yr	12-18
12. In-situ thermal desorption	7	8	9	9	5	7	180,000	30K/mo + 60K/yr	6
13. Chemical oxidation	6	7	7	5	6	5	180,000	20K/mo + 60K/yr	3-6
14. Cosolvent flushing	4	5	6	4	6	4	100,000	25K/mo + 60K/yr	3-6

## **Appendix A**

### **July, 2000, Semi-Annual Groundwater Monitoring Event Analytical Results**

# Remedial Operations Group, Inc.

TO: Dick Sloan  
FROM: Ron Jansen  
CC: Jim Thomson  
DATE: August 18, 2000  
RE: French Ltd. Project - Semi-annual Groundwater Monitoring

Attached are the analytical results for the July 2000 semi-annual ground water monitoring event at the French Limited Site in Crosby, Texas. All wells were sampled using the 'hybrid' well purge method as described in Ron Jansen's memo dated June 30, 1999(see Attachment D).

## 1.0 Sampling Summary

A total of forty-two (42) groundwater monitoring wells were sampled on July 6, 7, 10, 11, 12, 13, 14, 17 18 and 19, 2000. All samples were analyzed by American Analytical and Technical Services - Baton Rouge(AATS-BR) and the Remedial Operations Group, Inc. Lab at the Turtle Bayou Project. All samples were submitted to the lab under properly executed chain-of-custody documents. A sample collection summary is presented in Table 1. Table 2 lists the field QC samples with complete precision reports in Attachment C. A analysis description and methodology summary is presented in Table 3. The EPA contractor collected split samples on ten of the forty-two wells (S1-111, S1-121, S1-131, INT-026, INT-106, INT-123, INT-134, INT-135, INT-155 and INT-217). The data for the split samples was not available for evaluation at the printing of this report.

Pesticides/PCBs	Pesticides/PCBs - Priority Pollutant list	SW846 - 8080
Priority Pollutant Metals	Arsenic, Copper, Antimony, Beryllium, Cadmium, Chromium, Lead, Mercury, Nickel, Selenium, Silver, Thallium, Zinc	EPA 200.7 / SW 6010
TOC	Total Organic Carbon	EPA 415.1
Nutrients	Potassium Ammonia as N Nitrate as N Orthophosphate (P)	EPA 200.7 / SW 6010 EPA 350.3 EPA 353.2 EPA 365.2

### 1.1 Analytical Data Validation

All analytical data was validated manually for these samples. Table 4 outlines the QC checks made on this data as applicable to the analytical method. All analytical data met QA/QC requirements with the exception of those listed in Table 5. Field duplicate precision summaries, field and trip blank analytical summaries and MS/MSD analytical summaries are presented in Attachment C.

**TABLE 4**  
**QA/QC Validation Check Summary**

Validation Check
Holding Time - Method stated time between date sampled and date of extraction or analysis.
Method Sequence - Method stated sequence of analyses for instrument calibration and duration of sample analysis time after compliant calibration.
Initial Calibration (%RSD & RRF) - Percent relative standard deviation(%RSD): Verifies linearity over the stated calibration range - method specific. Relative response factor(RRF): Criteria ensures adequate instrument sensitivity for method specified analytes.
Continuing Calibration (%D) - Method stated percent difference range for calibration verification
Internal Standard Response(where applicable) - A measure of instrument stability
Surrogate Recovery - Surrogate compounds are added to the analysis procedure at a known concentration to verify method effectiveness. Surrogate recoveries are method specific ranges used to qualify analytical results.
Method Blank and Trip Blank Cleanliness - Laboratory prepared sample to verify sampling and analytical procedures in a clean matrix
MS/MSD Recovery & Precision Data - Checks sampling, preparation and analysis accuracy and precision
Blind Field Duplicate(BFD) Precision - Checks sampling, preparation and analysis reproducibility

**Table 5**  
**QC Exception Summary - July 2000 Event**

<b>Problem</b>	<b>Comment</b>
Internal std area count for naphthalene-d8 was outside control limits (low) for samples INT-237, Trip Blank#5 and INT-120.	Samples were not reanalyzed. Naphthalene is not a target analyte for this project. No corrective action necessary.
% recovery for chloroform on the end of analytical batch LCS from 07/24/00 was outside control limits (low).	The % recovery was based on a 50 ug/L purge, not a 5 ug/L purge. No corrective action required.
An incorrect surrogate solution was used for the pesticide/PCB analysis on samples INT-127, INT-127-D, INT-130RS, S1-123, INT-130R and INT-233.	The samples were initially extracted within holding times, but with the wrong surrogate solution added. The samples were subsequently extracted using the correct surrogate solution, but outside appropriate extraction holding times.
Surrogates were outside control limits for the semivolatile analysis of sample S1-123.	The sample was re-extracted one day outside appropriate extraction holding time and reanalyzed. All surrogates were within control limits for the second extraction/analysis.
Surrogate 12DCB-d4 was outside control limits for the semivolatile analysis of sample S1-106R.	The sample was re-extracted and reanalyzed. Surrogate 12DCB-d4 was outside control limits for the second extraction/analysis also.
The spike % recoveries for phenol and acenaphthene were outside control limits for the MSD on sample INT-120.	Precision (RPD) was within control limits for all compounds on the MS/MSD pair.
Precision (RPD) for 4-Nitrophenol was outside control limits for the MS/MSD pair on sample INT-233.	Acceptable spike % recovery ranges (accuracy) for this compound is very wide. The % recovery for the MS/MSD pair was 1% and 3% respectively.
Surrogate 12DCB-d4 was outside control limits for the semivolatile analysis of sample S1-108A.	The sample was not re-extracted and reanalyzed.
Surrogates 12DCB-d4 and Nbz-d5 were outside control limits for the semivolatile analysis of sample INT-022MS.	The sample was not re-extracted and reanalyzed.
Surrogate Nbz-d5 was outside control limits for the semivolatile analysis of sample INT-026.	The sample was not re-extracted and reanalyzed.
The spike for Hexachlorocyclopentadiene for the semivolatile analysis was outside control limits (low) for most of the Lab control samples (LCS) associated with the analysis of these samples.	No corrective action required.
Internal std area counts for the semivolatile analysis were outside control limits (low) for samples INT-022, INT-022MSD, S1-106A and S1-135.	Samples were INT-022, S1-106A and S1-135 were reanalyzed. The same internal std was still outside control limits. No corrective action required.
The Thallium spike % recovery was outside control limits (low) for all of the samples submitted for metals analysis.	The spike sample and spike sample duplicate % recoveries were both low for 24 of the samples (one sample delivery group). All of the LCS % recoveries for Thallium were within control limits. No corrective action required.
Arsenic values are estimated for 14 of the samples because of the presence of interference.	
The Mercury spike % recovery was outside control limits (low) for 14 of the samples submitted for metals analysis.	The spike sample and spike sample duplicate % recoveries were both low for 14 of the samples (one sample delivery group). All of the LCS % recoveries for Mercury were within control limits. No corrective action required.

**Remedial Operations Group, Inc.**

**Table 6**  
**Field Duplicate QC Summary**

Sample Name	Duplicate Name	Comments
INT-127	INT-127 Dup	SV: Di-N-butylphthalate RPD was 66.7%. Analyte also found in blank. Common lab contaminant. Nutrient: Ammonia-N RPD was 89.4%. Analyte detected just above detection limit of 0.1mg/L. Metals: Thallium RPD was 74.3%. Analyte apparently had some matrix interferences. See Table 5.
INT-134	INT-134 Dup	SV: Di-N-butylphthalate RPD was 66.7%. Analyte detected below detection limit ("J" qualifier). Common lab contaminant. Metals: Arsenic, nickel and zinc RPDs were 53.8%, 37.5% and 27.1% respectively.
S1-121	S1-121 Dup	SV: Bis(2-ethylhexyl)Phthalate and Di-N-butylphthalate RPDs were 100% and 66.7% respectively. % Analyte detected below detection limit ("J" qualifier). Common lab contaminant. Metals: Nickel and zinc RPDs were 22.2% and 53.5% respectively.

**1.2 Submissions**

All samples were analyzed using appropriate methods and analysis sequences for the requested parameters. There were no QC issues with respect to calibration or (where applicable) internal standard or surrogate compound responses. All laboratory control samples reported results within acceptance limits. All field duplicate samples were readily reproducible for all parameters requested. All samples met project QC criteria except for those listed in Table 5.

The QC issues presented in Table 5 do not adversely affect the data for its intended use.

Historical analytical data summaries for all compliance wells are presented in Attachment A. Full analytical data summaries for all requested parameters are presented in Attachment B.

**1.3 Data Evaluation**

All analytical data was summarized and submitted to project consultants and management for review. All analytical data reports submitted by the laboratory were examined for completeness and validated prior to entering the data into the project database. Complete analytical packages from the lab are available for review upon request.

DATE: August 18, 2000

RE: French Ltd. Project - Semi-annual Groundwater Monitoring

Attached are the analytical results for the July 2000 semi-annual ground water monitoring event at the French Limited Site in Crosby, Texas. All wells were sampled using the 'hybrid' well purge method as described in Ron Jansen's memo dated June 30, 1999(see Attachment D).

## 1.0 Sampling Summary

A total of forty-two (42) groundwater monitoring wells were sampled on July 6, 7, 10, 11, 12, 13, 14, 17 18 and 19, 2000. All samples were analyzed by American Analytical and Technical Services - Baton Rouge(AATS-BR) and the Remedial Operations Group, Inc. Lab at the Turtle Bayou Project. All samples were submitted to the lab under properly executed chain-of-custody documents. A sample collection summary is presented in Table 1. Table 2 lists the field QC samples with complete precision reports in Attachment C. A analysis description and methodology summary is presented in Table 3. The EPA contractor collected split samples on ten of the forty-two wells (S1-111, S1-121, S1-131, INT-026, INT-106, INT-123, INT-134, INT-135, INT-155 and INT-217). The data for the split samples was not available for evaluation at the printing of this report.

**Summary of Requested Analyses**

Parameter	Analysis Description	Method
VOA	Volatile organics Target compound list	SW846 - 8260
Semivolatiles	Semivolatile organics - Priority Pollutant list	SW846 - 8270
Pesticides/PCBs	Pesticides/PCBs - Priority Pollutant list	SW846 - 8080
Priority Pollutant Metals	Arsenic, Copper, Antimony, Beryllium, Cadmium, Chromium, Lead, Mercury, Nickel, Selenium, Silver, Thallium, Zinc	EPA 200.7 / SW 6010
TOC	Total Organic Carbon	EPA 415.1
Nutrients	Potassium Ammonia as N Nitrate as N Orthophosphate (P)	EPA 200.7 / SW 6010 EPA 350.3 EPA 353.2 EPA 365.2

### 1.1 Analytical Data Validation

All analytical data was validated manually for these samples. Table 4 outlines the QC checks made on this data as applicable to the analytical method. All analytical data met QA/QC requirements with the exception of those listed in Table 5. Field duplicate precision summaries are presented in Attachment C.

**TABLE 4**  
**QA/QC Validation Check Summary**

Validation Check
Holding Time - Method stated time between date sampled and date of extraction or analysis.
Method Sequence - Method stated sequence of analyses for instrument calibration and duration of sample analysis time after compliant calibration.
Initial Calibration (%RSD & RRF) - Percent relative standard deviation(%RSD): Verifies linearity over the stated calibration range - method specific. Relative response factor(RRF): Criteria ensures adequate instrument sensitivity for method specified analytes.
Continuing Calibration (%D) - Method stated percent difference range for calibration verification
Internal Standard Response(where applicable) - A measure of instrument stability
Surrogate Recovery - Surrogate compounds are added to the analysis procedure at a known concentration to verify method effectiveness. Surrogate recoveries are method specific ranges used to qualify analytical results.
Method Blank and Trip Blank Cleanliness - Laboratory prepared sample to verify sampling and analytical procedures in a clean matrix
MS/MSD Recovery & Precision Data - Checks sampling, preparation and analysis accuracy and precision
Blind Field Duplicate(BFD) Precision - Checks sampling, preparation and analysis reproducibility

# Remedial Operations Group, Inc.

**Table 5**  
**QC Exception Summary - July 2000 Event**

Problem	Comment
Internal std area count for naphthalene-d8 was outside control limits (low) for samples INT-237, Trip Blank#5 and INT-120.	Samples were not reanalyzed. Naphthalene is not a target analyte for this project. No corrective action necessary.
% recovery for chloroform on the end of analytical batch LCS from 07/24/00 was outside control limits (low).	The % recovery was based on a 50 ug/L purge, not a 5 ug/L purge. No corrective action required.
An incorrect surrogate solution was used for the pesticide/PCB analysis on samples INT-127, INT-127-D, INT-130RS, S1-123, INT-130R and INT-233.	The samples were initially extracted within holding times, but with the wrong surrogate solution added. The samples were subsequently extracted using the correct surrogate solution, but outside appropriate extraction holding times.
Surrogates were outside control limits for the semivolatile analysis of sample S1-123.	The sample was re-extracted one day outside appropriate extraction holding time and reanalyzed. All surrogates were within control limits for the second extraction/analysis.
Surrogate 12DCB-d4 was outside control limits for the semivolatile analysis of sample S1-106R.	The sample was re-extracted and reanalyzed. Surrogate 12DCB-d4 was outside control limits for the second extraction/analysis also.
The spike % recoveries for phenol and acenaphthene were outside control limits for the MSD on sample INT-120.	Precision (RPD) was within control limits for all compounds on the MS/MSD pair.
Precision (RPD) for 4-Nitrophenol was outside control limits for the MS/MSD pair on sample INT-233.	Acceptable spike % recovery ranges (accuracy) for this compound is very wide. The % recovery for the MS/MSD pair was 1% and 3% respectively.
Surrogate 12DCB-d4 was outside control limits for the semivolatile analysis of sample S1-108A.	The sample was not re-extracted and reanalyzed.
Surrogates 12DCB-d4 and Nbz-d5 were outside control limits for the semivolatile analysis of sample INT-022MS.	The sample was not re-extracted and reanalyzed.
Surrogate Nbz-d5 was outside control limits for the semivolatile analysis of sample INT-026.	The sample was not re-extracted and reanalyzed.
The spike for Hexachlorocyclopentadiene for the semivolatile analysis was outside control limits (low) for most of the Lab control samples (LCS) associated with the analysis of these samples.	No corrective action required.
Internal std area counts for the semivolatile analysis were outside control limits (low) for samples INT-022, INT-022MSD, S1-106A and S1-135.	Samples were INT-022, S1-106A and S1-135 were reanalyzed. The same internal std was still outside control limits. No corrective action required.
The Thallium spike % recovery was outside control limits (low) for all of the samples submitted for metals analysis.	The spike sample and spike sample duplicate % recoveries were both low for 24 of the samples (one sample delivery group). All of the LCS % recoveries for Thallium were within control limits. No corrective action required.
Arsenic values are estimated for 14 of the samples because of the presence of interference.	
The Mercury spike % recovery was outside control limits (low) for 14 of the samples submitted for metals analysis.	The spike sample and spike sample duplicate % recoveries were both low for 14 of the samples (one sample delivery group). All of the LCS % recoveries for Mercury were within control limits. No corrective action required.

## 1.2 Submissions

All samples were analyzed using appropriate methods and analysis sequences for the requested parameters. There were no QC issues with respect to calibration or (where applicable) internal standard or surrogate compound responses. All laboratory control samples reported results within acceptance limits. All field duplicate samples were readily reproducible for all parameters requested. All samples met project QC criteria except for those listed in Table 5.

The QC issues presented in Table 5 do not adversely affect the data for its intended use.

Historical analytical data summaries for all compliance wells are presented in Attachment A. Full analytical data summaries for all requested parameters are presented in Attachment B.

## 1.3 Data Evaluation

## **Remedial Operations Group, Inc.**

---

**All analytical data was summarized and submitted to project consultants and management for review. All analytical data reports submitted by the laboratory were examined for completeness and validated prior to entering the data into the project database. Complete analytical packages from the lab are available for review upon request.**

Number in parentheses indicates compound's cleanup criteria :

CONDU = Specific Conductivity (NC)

DO = Dissolved Oxygen (NC)

DTOWT = Depth to Water (NC)

< Less than shown detection limit

FLDPH = Field pH (NC)

TEMP = Temperature (NC)

AS = Arsenic ( 50 )

J Detected conc. below detection limit

CR = Chromium ( 100 )

PB = Lead ( 15 )

TOC = Total Organic Carbon (NC)

E Conc. exceeded instrument calibration range

K = Potassium (NC)

NH3N = Ammonia-N (NC)

NO3N = Nitrate-N (NC)

B Analyte also found in method blank

O-PO4-P = Orthophosphate-P (NC)

12DCA = 1,2-Dichloroethane ( 5 )

ACET = Acetone ( 3500 )

D Concentration derived from dilution

BENZ = Benzene ( 5 )

CCL4 = CARBON TETRACHLORIDE (NC)

TOL = Toluene ( 1000 )

NC = No cleanup criteria

### MEMO

**TO:** Mark Collins, Operators  
**FROM:** Ron Jansen  
**CC:** Dick Sloan, Jim Thomson  
**DATE:** 06/30/99  
**SUBJECT:** Semi-annual Sampling Event at French Ltd. Project, July, 1999

This memo describes a procedure to be utilized for the groundwater sampling event to take place the week of July 5, 1999. The following procedure will be used to collect groundwater samples from all of the normal remediation progress monitoring wells at the French Ltd. Site.

Prior to sampling any wells, the following wells will be rehabilitated according to the "Post-Flood Rehabilitation Check List": INT-127, INT-130R, INT-130RS, S1-106A and S1-108A.

#### General Description

This method describes a hybrid of micro-purge and standard well bailing groundwater sampling(purging three well volumes). As with the micro-purge method, there will be a relatively small volume of purge water. As with conventional well bailing, the confidence in sample representativeness should be greater.

A pump will be placed between the water surface and the top of the screen (10 feet below water surface is ideal). As water is purged from the well, water from the aquifer will displace the stagnant water between the top of the casing and the pump. Because each well is different (water level, screen depth/length, etc.), the levels at which the pump should be placed and the number of purge cycles may be different.

#### Equipment / Material

Groundwater sampling trailer (with variable speed pump, decon facilities and purge water holding tank); micro-purge pump; standard sampling supplies (sample containers, ice chests; field measurement instruments, PPE, etc.)

#### Procedure

Before measuring water levels, all wells fitted with sealing-type well caps should have the caps removed, and water levels should be allowed to equilibrate with the surface air pressure(this process takes approximately one hour). All wells should initially be measured for depth to water level and all readings recorded properly. The well sampling sequence should strictly follow the attached sheet. Prior to collecting a sample, the well purge pump should be placed at the levels specified on the attached Table. Water should be purged out of the well according to the depths and intervals shown in Table 1. The water will be pumped out of the well until the water level is down to the level of the pump. The water level will be allowed to recover to within 1½ feet of the original water level. Repeat this procedure the number of times specified in Table 1 for each well. After the last cycle of purging, the pump and purge hose should be removed from the well and decontaminated thoroughly. The water level will be allowed to recover to within 1½ feet of the original water level prior to collecting a sample via the stainless steel micro-purge tubing installed in the well.

Analytical requirements for the groundwater samples and field data sheets are attached. Please note that samples for metals analysis should be filtered in the field with a 0.45 micron in-line filter. Only use the in-line filter when filling the sample containers for metals analysis (250 ml to 1000 ml plastic with nitric acid). Other than the above stated changes in sampling/purging protocol, the remainder of the sampling event should be the same as in all previous sampling events (e.g. requested analytical tests, field measurements, etc.)

Re: Migration Wall Evaluation

Dear Ernest:

The French site closure plan calls for evaluation of the migration control wall every five years. The attached report summarizes the evaluation that was done in May, 2000.

The thickness of the steel wall was measured at three locations above the water table and at three locations below the water table. The wall retains 95% to 100% of the original wall thickness; there is no indication of any corrosion or degradation since the wall was installed in 1989.

Please contact me if you have any questions or comments.

Sincerely,

R.L. Sloan

Subject: Ultrasonic and Visual Permeability Examination of  
Lagoon Sheet Piles

Enclosed are the results of the sheet pile test conducted during  
the 5-year scheduled examination.

The test was conducted at a different location than was stated in  
the work plan. Water levels in the west marsh prevented the  
operators from excavating in the area of the 1995 test. The May,  
2000, test was conducted outside the wall opposite the P-6  
monitoring well aligned with INT-59 P-2.

Since there has been no evidence of corrosion or degradation of  
the metal, please advise if any additional testing will be  
scheduled.
